

## **Colorization**

Scan a 72-ppi current picture of yourself. It should be approximately 8X10 and a TIFF. Change it to a Grayscale image if it is not already (Image>Mode>Grayscale). Then go back and change it to RGB (Image>Mode>RGB). That is so we can add color to the grayscale image. Then follow the instructions found in the movie to colorize your picture.

Send the completed .tif file to me as an attachment.
